## Chapter 3

3-1

| Year | Price | Annual <br> Return |
| :--- | :--- | :--- |
| 1989 | 1.2 |  |
| 1990 | 2.09 | 0.741667 |
| 1991 | 4.64 | 1.220096 |
| 1992 | 5.34 | 0.150862 |
| 1993 | 5.05 | -0.05431 |
| 1994 | 7.64 | 0.512871 |
| 1995 | 10.97 | 0.435864 |
| 1996 | 20.66 | 0.883318 |
| 1997 | 32.31 | 0.563892 |
| 1998 | 69.34 | 1.146085 |
|  | average | 0.622261 |

a. The average annual return is $62.23 \%$
b. The standard deviation is $42.49 \%$

The variance is 0.1805
c. No. The firm is changing its business mix, is under increasing assault for monopolistic practices and is accumulating cash. I would expect all of these factors to change its risk profile.

3-2

| Year | Price | Dividends Return |  |
| :--- | :--- | :--- | :--- |
| 1989 | 36.1 | 3 |  |
| 1990 | 33.6 | 3 | $1.39 \%$ |
| 1991 | 37.8 | 3 | $21.43 \%$ |
| 1992 | 30.9 | 2.3 | $-12.17 \%$ |
| 1993 | 26.8 | 1.6 | $-8.09 \%$ |
| 1994 | 24.8 | 1.6 | $-1.49 \%$ |
| 1995 | 31.6 | 1.6 | $33.87 \%$ |
| 1996 | 28.5 | 1.6 | $-4.75 \%$ |
| 1997 | 24.25 | 1.6 | $-9.30 \%$ |
| 1998 | 35.6 | 1.6 | $53.40 \%$ |
|  | average |  | $8.25 \%$ |
|  | std |  | $22.84 \%$ |
|  | variance |  | 0.0521 |

a. The average annual return is $8.25 \%$
b. The standard deviation is $22.84 \%$, and the variance is 0.0521
c. I would not expect the same variance and standard deviation of returns because utilities have become much more deregulated today and face a lot of competition.

3-3
Year Scientific Atlanta AT\&T
$\begin{array}{lll}1989 & 80.95 & 58.26\end{array}$

| 1990 | -47.37 | -33.79 |
| :--- | :--- | :--- |
| 1991 | 31 | 29.88 |
| 1992 | 132.44 | 30.35 |
| 1993 | 32.02 | 2.94 |
| 1994 | 25.37 | -4.29 |
| 1995 | -28.57 | 28.86 |
| 1996 | 0 | -6.36 |
| 1997 | 11.67 | 48.64 |
| 1998 | 36.19 | 23.55 |
| average | 27.37 | 17.804 |
| s.d. | 51.36 | 27.89 |
| covariance 774.48 |  |  |
| correlation 0.54 |  |  |

a. The average return over the ten years is $27.37 \%$ for Scientific Atlanta and $17.8 \%$ for AT\&T. The standard deviations are $51.36 \%$ and $27.89 \%$ respectively.
b. The covariance is 774.48 , while the correlation coefficient 0.54 .
c. The variance of a portfolio composed equally of the two investments equals $(0.5)^{2}(51.36)^{2}+(0.5)^{2}(27.89)^{2}+2(51.36)(27.89)(0.5)(0.5)(0.54)=1240.68$; the standard deviation is $35.22 \%$

## 3-4

a. You'd pick the stock market portfolio, since it dominates gold on both average return and standard deviation.
b. The higher possible returns on gold are balanced by the lower possible returns at other times. Note that the average return on gold is much less than that on the stock market. c. The expected return on this portfolio would be $(8+20) / 2=14 \%$. The variance would equal $(0.5)^{2}(25)^{2}+(0.5)^{2}(22)^{2}-2(0.5)(0.5)(25)(22)(0.4)=167.25$; the standard deviation equals $12.93 \%$
d. If the supply of gold is negatively correlated with the level of the market, and the price of gold is inversely related to the supply of gold, we have a positive correlation between the return on the market and the return on gold. This would make gold less desirable, since it does not help as much in reducing portfolio variance. The optimal amount to invest in gold would drop.

## 3-5

a. The average return on the portfolio equals $(0.6) 25+(0.4) 12=19.8 \%$

The variance of returns equals $(0.6)^{2}(36)^{2}+(0.4)^{2}\left(22^{2}\right)+2(0.4)(0.6)(36)(22)(0.28)=$ 650.44 ; the standard deviation of returns $=25.5 \%$
b. The minimum variance portfolio is given by
$\mathrm{w}_{\mathrm{CC}}=\left[22^{2}-(22)(36)(0.28)\right] /\left[22^{2}+36^{2}-2(22)(36)(0.28)\right]=262.24 / 1336.48=0.1962$; the weight in Texas Utilities is $1-0.1962=0.8038$.

## 3-6

Times Mirror o 25\%
Unilever $\sigma \quad 40 \%$
correlation Portfolio Variance s.d.

| -1 | 56.25 | $7.50 \%$ |
| :--- | :--- | :--- |
| -0.8 | 156.25 | $12.50 \%$ |
| -0.6 | 256.25 | $16.01 \%$ |
| -0.4 | 356.25 | $18.87 \%$ |
| -0.2 | 456.25 | $21.36 \%$ |
| 0 | 556.25 | $23.58 \%$ |
| 0.2 | 656.25 | $25.62 \%$ |
| 0.4 | 756.25 | $27.50 \%$ |
| 0.6 | 856.25 | $29.26 \%$ |
| 0.8 | 956.25 | $30.92 \%$ |
| 1 | 1056.25 | $32.50 \%$ |

3-7
The portfolio variance equals
$(1 / 3)^{2}(23)^{2}+(1 / 3)^{2}(27)^{2}+(1 / 3)^{2}(50)^{2}+2(1 / 3)(1 / 3)(23)(27)(-0.15)$
$+2(1 / 3)(1 / 3)(27)(50)(-0.25)+2(1 / 3)(1 / 3)(23)(50)(0.2)=360.97$
The standard deviation $=19 \%$
3-8
I would need to compute 1250 expected returns and 1250 variances.
b. I would need to compute $1250(1249) / 2=780625$ distinct covariances.

3-9
The variance of a portfolio consisting of N securities can be estimated as $(1 / \mathrm{N})$ (average variance $)+(1-1 / \mathrm{N})($ average covariance $)=10+(50-10) / \mathrm{N}$.

| Number of securities in portfolio (N) | Estimated portfolio variance |
| :---: | :---: |
| 5 | 18 |
| 10 | 14 |
| 20 | 12 |
| 50 | 10.8 |
| 100 | 10.4 |

We must solve $10+40 / \mathrm{N}=1.1(10)=11$, or $\mathrm{N}=40$
3-10
The expected return on the new portfolio $=0.2(5)+(0.8) 12=10.6 \%$
The standard deviation of returns on the new portfolio $=0.8(25)=20 \%$
3-11
a. Invest everything in the riskless asset.
b. Solve $0.15=\mathrm{w}(0.3)$ to get $\mathrm{w}=0.5$; invest $50 \%$ in each asset.
c. Invest everything in the market portfolio
d. Solve $0.45 \mathrm{w}(0.3)$ to get $\mathrm{w}=1.5$; the investor should borrow $50 \%$ of his own outlay at the riskfree rate and invest the borrowing as well as his own outlay in the market portfolio.
e. Solve $\mathrm{w}(15)+(1-\mathrm{w}) 5=12$ to get $\mathrm{w}=0.7$; invest $70 \%$ in the market portfolio and the rest in the riskfree asset.

3-12
a. The covariance of returns between Scientific Atlanta and the market portfolio $=$ -13.07
b. The variance of returns is 2637.56 for Scientific Atlanta and 209.88 for the market portfolio
c. The beta of Scientific Atlanta equals $-13.07 / 209.88=-0.0623$

3-13
a. Solve $1.5=$ Covariance $\left(R_{U A}, R_{m k t}\right) / 22^{2}$. Hence the covariance equals 726 . The correlation between United Airlines and the market can be computed as $726 /(22 \times 66)=0.5$
b. The share of market risk in United Airlines risk is $(0.5)^{2}$ or $25 \%$.

3-14
a. Bethlehem Steel is most exposed to the fourth factor. One can try to identify the factors by regressing the estimated factors on various macroeconomic variables. The APT, itself, does not identify the factors.
b. If the riskfree rate is $5 \%$, the expected return on Bethlehem Steel would be $5+$ $1.2(2.5)+0.6(1.5)+1.5(1)+2.2(0.8)+0.5(1.2)=12.76 \%$
c. Using the CAPM, the expected return would be $5+1.1(5)=10.5 \%$
d. The expected returns could be different if there are other risks that the market deems relevant that are not adequately captured in the market portfolio.

3-15
The expected return on Emerson Electric would be $6+0.5(1.8)+1.4(0.6)+1.2(1.5)$ $+1.8(4.2)=17.1 \%$

3-16
a. The expected annual return on Lucent Technologies would be 1.77-0.11(ln $1800)+0.35(\ln (735 / 1800)$, which works out to $0.63 \%$ per month. On an annual basis, this would work out to $7.58 \%$ without compounding and $7.85 \%$ with compounding ( $\left(1.0063^{12}-1\right)$
b. Under the CAPM, the expected return is $6 \%+1.55(5.5)=14.525 \%$ per annum.
c. The two approaches differ because they use different measures of risk. The first one uses an empirical proxy, while the second one uses a measure derived from theory.
