86. Why would the English system of units be more useful if a foot contained 10 inches?

ANSWER: Because our number system is base-10, having units based on 10 simplifies calculations. Fractions could be expressed in decimal notation. Prefixes could be used, such as milli-, centi-, kilo- to express lengths of varying orders of magnitudes.

87. Why do we measure some distances in astronomy in light-years and some in astronomical units?

ANSWER: Consider using millimeters to describe the distance between New York and California, 3,920,000,000 millimeters. This distance is correct, but it is far more convenient to state the distance as 3920 kilometers. Distances in astronomy are huge when compared to distances we measure on Earth. It is simpler and more convenient to use larger distance units for discussion and calculations.

DATE MODIFIED: 6/4/2016 3:09 PM

89. "I live 20 minutes from Center City." How is this statement similar to giving astronomical distances in light-years?

ANSWER: Twenty minutes is a measurement of time. In this case, the person speaking is referring to the time it takes to travel from City Center to home. If someone says an object is a distance of a certain number of light years, this is incorrect. Light-years is a measurement of distance. It is a common misperception that a light-year is a unit of time, because it has the word "year".

92. Briefly describe the scientific method.

ANSWER: The scientific method is a process scientists use to better understand the natural world. It is a combination of many ways of analyzing information, finding relationships, and creating new ideas. Scientists use insight and ingenuity to form, test, revise, and possibly discard hypotheses, in the quest to gain a fundamental understanding of nature.

93. Draw a schematic (not to scale) diagram showing the Sun, the Earth circling around it, and the other seven planets with labels for each orbit.

ANSWER: Diagram should show the Sun and the eight planets in order: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune.

Chapter 1. Here and Now

POINTS: 1
REFERENCES: Figures 1-6 and 1-7
QUESTION TYPE: Essay
HAS VARIABLES: False
DATE CREATED: 4/11/2014 2:50 PM
DATE MODIFIED: 6/4/2016 3:10 PM

94. Assume a textbook shows a diagram of the solar system on, say, a standard notebook-sized sheet. The orbits of eight planets are sketched around the Sun at the center. The planets and orbits are drawn large enough that features like continents on Earth or the rings of Saturn are clearly visible. The Sun is drawn large enough that sunspots are clearly visible. Discuss what is wrong or right with this diagram.

ANSWER: The diagram is correct in that there are eight planets orbiting the Sun. It is incorrect in several ways. One, if the Sun and planets were drawn to scale, it would be impossible to make out surface features of the Sun or Earth, or the rings of Saturn. Two, although the planets orbit the Sun, the orbits are not perfect circles but ellipses.

POINTS: 1
