Question 116	Essay			0 points
Question Exhibit: Quantity Consumed and Price of Good				
		Base Year	Later Year	
	Price of good A	100	200	
	Quantity of good A	100	200	
	Price of good B	100	100	
	Quantity of good B	100	100	

In the exhibit, the citizens of country XYZ come to desire more of good A. As a result, the quantity and price of the good both rise.

- a. Compute nominal GDP in the base year and later year.
- b. Compute real GDP in the base and later years (in base-year prices).
- c. Compute the GDP deflator in the later year, using your answers to parts a and b.
- d. Compute a fixed-weight price index for the later year, using the base-year quantities as weights.
- e. Which price index rises faster, the GDP deflator (Paasche) index or the fixed-weight index (Laspeyres) index?
- **Answer** a. Base-year nominal GDP = 20,000. Later-year nominal GDP = 50,000.
 - b. Real GDP in base year = 20,000. Real GDP in later year = 30,000.
 - c. GNP deflator in later year = 1.667.
 - d. Fixed-weight index = 1.50.
 - e. The Paasche index, with current quantity weights, rises faster in this case than the base-year quantity-weighted Laspeyres index.

Add Question Here Modify 0 points Remove Assume two countries have the same nominal GDP (measured in the same currency using the same accounting rules). Explain at least three reasons why you cannot assume that citizens in each country enjoy

Answer Some possible, but not all, explanations include:

approximately the same level of economic well-being.

- different price levels in the two countries would result in different amounts of real a. GDP, i.e., different quantities of goods and services available in each country;
- b. different-sized populations could result in different quantities of goods and services available per person in each country;
- c. different levels of nonmarket production in the two countries would alter the quantity of goods and services available in each country;
- d. different amounts of leisure time available (not captured in nominal GDP figures) would cause economic well-being to differ in the two countries;
- different distributions of income in the two countries could alter the quantity of e. goods and services available to the typical citizen in each country;
- f. different quantities of both positive and negative externalities associated with producing GDP, such as pollution and congestion, which are not measured in GDP, would cause the different levels of economic well-being between the two countries.

Question 117 Essay

Question

Question

Economic statistics are not perfect. Explain at least one way in which each of the following statistics as currently calculated in the United States fails to completely or accurately measure the corresponding economic concept (in parentheses):

a. real GDP per person (economic well-being);

b. CPI (cost of livina):

c. unemployment rate (involuntary unemployment).

- Answer a. The official measure of GDP does not include measurements of leisure time available, nonmarket production, production in the underground economy, the distribution of income, or production externalities (e.g., pollution).
 - The CPI does not allow substitution away from products with rising prices and has difficulty b. distinguishing between price changes and quality changes in products included in the index.
 - The official unemployment rate does not take into account discouraged workers, part-time c. workers who desire full-time employment, and workers employed in jobs not matching their skill level, such as taxi drivers with PhDs in physics.

Question 119 Essav

Question

There are a number of statistics computed to measure the price level, such as the GDP deflator and the CPI. The choice of which of these measures to use depends in many cases on the specific question in which you are interested. For each of the following situations, state whether the CPI or GDP deflator is a more appropriate measure to use and explain why the statistic is preferred.

- a. You are interested in looking at the impact of higher prices of imported oil in the overall cost of living.
- b. The government is interested in whether increases in defense spending are affecting the price level.
- An economic consulting firm is investigating the impact on the aggregate price level of more C. computers and electronic technology used in production.

0 points

Add Question Here

- Answer a. The CPI is the more appropriate statistic, because the price of imports is not included in the GDP deflator.
 - b. The GDP deflator is the more appropriate statistic, because the CPI does not include the prices of goods and services purchased by the government sector.
 - The GDP deflator is more appropriate, because the CPI does not include prices of goods and c. services purchased by businesses or the government sector.

	Question	
	One senator criticizes the government for making an inadequate effort to stimulate the economy based on data from the BLS establishment survey that shows the number of jobs in the economy has fallen. Another senator counters that the number of employed workers in the economy has increased over the same period, based on	

Answer If the number of self-employed workers and workers employed in new start-up firms (who are included in the household survey, but not in the establishment survey) has increased more rapidly than the decline in payroll jobs counted in the establishment survey, then the number of employed workers as measured in the household survey could increase while the number of payroll jobs decreases.

Question 121	Essay	0 points		
	Question			
	There are a number of measures of addregate economic activity	v such as GDP GNP	national income	nerson

a number of measures of aggregate economic activity, such as GDP, GNP, national income, personal income, and disposable personal income. Each of these measures can be a good indicator depending on the issue under consideration. For each of the following issues, give your reasons for selecting one of the measures just mentioned as the best indicator to use in studying the issue:

a. the proportion of income households save;

b. the relative share of earnings going to labor versus capital;

the BLS household survey. Explain how both senators can be correct.

c. the total output of new final goods and services.

- Answer a. Disposable personal income provides a measure of the income households have to use for either consumption or saving after they pay taxes.
 - b. National income provides a measure of the income going to the factors of production.
 - GDP is the most complete measure of the value of newly produced goods and services in the C. economy. In contrast, personal income includes transfer payments, which do not represent newly produced goods and services.

Question 122 Essay

Question

Real GDP per capita is an imperfect measure of economic well-being because it does not value home production nor production in the underground economy, among other factors. Give at least two examples that show why the omission of these types of items will make a difference in evaluating economic well being. One example should explain how the omissions distort comparisons of economic well being across countries and the other example should explain how the omission distorts comparisons of economic well being in the same country over time.

Answer Answers will vary, but one example could show that measured GDP in one country could be much lower than in another country, but the amount of home production in the first country could be very large. In this case, measured real GDP indicates a much larger difference in economic well being than actually exists between the countries.

The other example could explain how changes in the amount of home production in a country over time make it difficult to compare economic well being over time. For example, if most people grew their own food initially and then over time moved to commercial agriculture, the increase in real GDP per person would overstate the increase in the amount of goods and services available in the country, since the food grown at home was not counted in real GDP in the early period.

Question 124	Essay		0 points	Modify Remove
	Question			

Explain why the value of GDP in 2009 would or would not change as a result of each transaction described below.

a. In 2009. the Smith family purchases a new house that was built in 2009.

b. In 2009, the Jones family purchases a house that was built in 2001.

c. In 2009, a construction company purchases windows to put in the Smith family home that was built in 2009.

d. In 2009. Mr. Jones paints all of the rooms of the Jones family house purchased in 2009.

e. In 2009, Mr. Smith uses an online brokerage service to purchases shares of stock in a construction company.

Answer a. GDP in 2009 increases by the purchase price of the house, which is a newly produced good.

b. GDP in 2009 does not change because the house is *not* a newly produced good, since it was built in 2001. Transactions involving used goods are not included in GDP.

c. GDP in 2009 does not change directly because the windows are intermediate goods, not final goods. The value of intermediate goods is not included in GDP to avoid double counting. The value of the windows is implicitly included in the price of the house.

d. GDP in 2009 does not change because home production is not included in GDP.

e. GDP in 2009 does not change because financial transactions do not represent the production of final goods and services and are not included in GDP.

Question 125	Essay	0 p	oints
	Question		

Explain which expenditure category of GDP changes and the direction of the change that results for each transaction described.

a. A domestic business purchases a domestically produced computer to use in a business office.

b. A domestic business produces a computer that is sold to a foreign company.

c. The Federal Government purchases a domestically produced computer to use in a courthouse.

d. A domestic household purchases a domestically produced computer to use in a home.

e. A domestic household purchases a computer produced in a foreign country to use in a home.

Answer a. Investment spending increases by the price of the computer.

- b. Exports (and net exports) increase by the price of the computer.
- c. Government spending increases by the price of the computer.
- d. Consumption spending increases by the price of the computer.

e. Consumption spending increases by the price of the computer, but imports also increase by the price

of the computer, so that net exports decrease by the price of the computer and there will be no net change in GDP.
