

CHAPTER 2

2.1 Two possible versions can be developed:

```

IF x ≥ 10 THEN
  DO
    x = x - 5
    IF x < 50 EXIT
  END DO
ELSE
  IF x < 5 THEN
    x = 5
  ELSE
    x = 7.5
  END IF
ENDIF

```

```

IF x ≥ 10 THEN
  DO
    x = x - 5
    IF x < 50 EXIT
  END DO
ELSEIF x < 5
  x = 5
ELSE
  x = 7.5
ENDIF

```

2.2

```

DO
  i = i + 1
  IF z > 50 EXIT
  x = x + 5
  IF x > 5 THEN
    y = x
  ELSE
    y = 0
  ENDIF
  z = x + y
ENDDO

```

2.3 Students could implement the subprogram in any number of languages. The following VBA program is one example. It should be noted that the availability of complex variables in languages such as Fortran 90 would allow this subroutine to be made even more concise. However, we did not exploit this feature, in order to make the code more compatible with languages that do not support complex variables.

```

Option Explicit

Sub Rootfind()
  Dim ier As Integer
  Dim a As Double, b As Double, c As Double
  Dim r1 As Double, i1 As Double, r2 As Double, i2 As Double
  a = 7: b = 6: c = 2
  Call Roots(a, b, c, ier, r1, i1, r2, i2)
  If ier = 0 Then
    MsgBox "No roots"
  ElseIf ier = 1 Then
    MsgBox "single root=" & r1
  ElseIf ier = 2 Then
    MsgBox "real roots = " & r1 & ", " & r2
  ElseIf ier = 3 Then
    MsgBox "complex roots = " & r1 & ", " & i1 & " i" & "; "_
      & r2 & ", " & i2 & " i"
  End If
End Sub

Sub Roots(a, b, c, ier, r1, i1, r2, i2)
  Dim d As Double
  r1 = 0: r2 = 0: i1 = 0: i2 = 0

```

PROPRIETARY MATERIAL. © The McGraw-Hill Companies, Inc. All rights reserved. No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.

```

If a = 0 Then
  If b <> 0 Then
    r1 = -c / b
    ier = 1
  Else
    ier = 0
  End If
Else
  d = b ^ 2 - 4 * a * c
  If (d >= 0) Then
    r1 = (-b + Sqr(d)) / (2 * a)
    r2 = (-b - Sqr(d)) / (2 * a)
    ier = 2
  Else
    r1 = -b / (2 * a)
    r2 = r1
    i1 = Sqr(Abs(d)) / (2 * a)
    i2 = -i1
    ier = 3
  End If
End If
End Sub

```

The answers for the 3 test cases are: (a) $-0.3542, -5.646$; (b) 0.4 ; (c) $-0.4167 + 1.4696i; -0.4167 - 1.4696i$.

Several features of this subroutine bear mention:

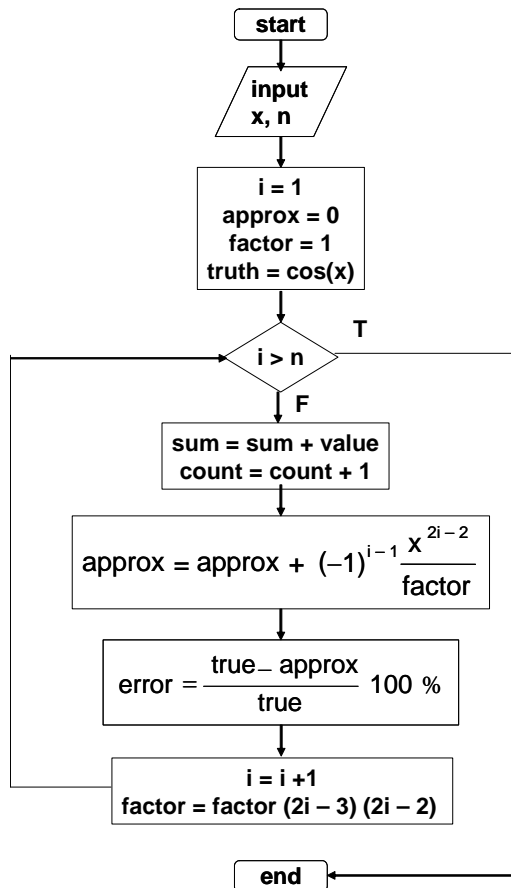

- The subroutine does not involve input or output. Rather, information is passed in and out via the arguments. This is often the preferred style, because the I/O is left to the discretion of the programmer within the calling program.
- Note that a variable is passed (IER) in order to distinguish among the various cases.

2.4 The development of the algorithm hinges on recognizing that the series approximation of the cosine can be represented concisely by the summation,

$$\sum_{i=1}^n (-1)^{i-1} \frac{x^{2i-2}}{(2i-2)!}$$

where i = the order of the approximation.

(a) Structured flowchart

(b) Pseudocode:

```

SUBROUTINE Coscomp(n,x)
  i = 1
  approx = 0
  factor = 1
  truth = cos(x)
  DO
    IF i > n EXIT
    approx = approx + (-1)i-1 * x2*i-2 / factor
    error = (true - approx) / true * 100
    DISPLAY i, true, approx, error
    i = i + 1
    factor = factor * (2*i-3) * (2*i-2)
  END DO
END
  
```

2.5 Students could implement the subprogram in any number of languages. The following MATLAB M-file is one example. It should be noted that MATLAB allows direct calculation of the factorial through its intrinsic function `factorial`. However, we did not exploit this feature, in order to make the code more compatible with languages such as Visual BASIC and Fortran.

```

function coscomp(x,n)
  i = 1;
  tru = cos(x);
  approx = 0;
  f = 1;
  
```

PROPRIETARY MATERIAL. © The McGraw-Hill Companies, Inc. All rights reserved. No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.

```

fprintf('\n');
fprintf('order true value approximation error\n');
while (1)
    if i > n, break, end
    approx = approx + (-1)^(i - 1) * x^(2*i-2) / f;
    er = (tru - approx) / tru * 100;
    fprintf('%3d %14.10f %14.10f %12.8f\n',i,tru,approx,er);
    i = i + 1;
    f = f*(2*i-3)*(2*i-2);
end

```

Here is a run of the program showing the output that is generated:

```

>> coscomp(1.25,6)

order true value approximation error
 1 0.3153223624 1.0000000000 -217.13576938
 2 0.3153223624 0.2187500000 30.62655045
 3 0.3153223624 0.3204752604 -1.63416828
 4 0.3153223624 0.3151770698 0.04607749
 5 0.3153223624 0.3153248988 -0.00080437
 6 0.3153223624 0.3153223323 0.00000955

```

2.6 (a) The following pseudocode provides an algorithm for this problem. Notice that the input of the quizzes and homeworks is done with logical loops that terminate when the user enters a negative grade:

```

INPUT WQ, WH, WF
nq = 0
sumq = 0
DO
    INPUT quiz (enter negative to signal end of quizzes)
    IF quiz < 0 EXIT
    nq = nq + 1
    sumq = sumq + quiz
END DO
AQ = sumq / nq
nh = 0
sumh = 0
DO
    INPUT homework (enter negative to signal end of homeworks)
    IF homework < 0 EXIT
    nh = nh + 1
    sumh = sumh + homework
END DO
AH = sumh / nh
DISPLAY "Is there a final grade (y or n)"
INPUT answer
IF answer = "y" THEN
    INPUT FE
    AG = (WQ * AQ + WH * AH + WF * FE) / (WQ + WH + WF)
ELSE
    AG = (WQ * AQ + WH * AH) / (WQ + WH)
END IF
DISPLAY AG
END

```

(b) Students could implement the program in any number of languages. The following VBA code is one example.

```

Sub Grader()
Dim WQ As Double, WH As Double, WF As Double
Dim nq As Integer, sumq As Double, AQ As Double
Dim nh As Integer, sumh As Double, AH As Double
Dim answer As String, FE As Double
Dim AG As Double

'enter weights
WQ = InputBox("enter quiz weight")
WH = InputBox("enter homework weight")
WF = InputBox("enter final exam weight")
'enter quiz grades
nq = 0
sumq = 0
Do
    quiz = InputBox("enter negative to signal end of quizzes")
    If quiz < 0 Then Exit Do
    nq = nq + 1
    sumq = sumq + quiz
Loop
AQ = sumq / nq
'enter homework grades
nh = 0
sumh = 0
Do
    homework = InputBox("enter negative to signal end of homeworks")
    If homework < 0 Then Exit Do
    nh = nh + 1
    sumh = sumh + homework
Loop
AH = sumh / nh
'determine and display the average grade
answer = InputBox("Is there a final grade (y or n)")
If answer = "y" Then
    FE = InputBox("final grade:")
    AG = (WQ * AQ + WH * AH + WF * FE) / (WQ + WH + WF)
Else
    AG = (WQ * AQ + WH * AH) / (WQ + WH)
End If
MsgBox "Average grade = " & AG
End Sub

```

The results should conform to:

$$AQ = 437/5 = 87.4$$

$$AH = 541/6 = 90.1667$$

without final

$$AG = \frac{35(87.4) + 30(90.1667)}{35 + 30} = 88.677$$

with final

$$AG = \frac{35(87.4) + 30(90.1667) + 35(92)}{35 + 30 + 35} = 89.84$$

2.7 (a) Pseudocode:

```

IF a > 0 THEN
    tol = 10-5

```

```

x = a/2
DO
  y = (x + a/x)/2
  e = |(y - x)/y|
  x = y
  IF e < tol EXIT
END DO
SquareRoot = x
ELSE
  SquareRoot = 0
END IF

```

(b) Students could implement the function in any number of languages. The following VBA and MATLAB codes are two possible options.

VBA Function Procedure	MATLAB M-File
<pre> Option Explicit Function SquareRoot(a) Dim x As Double, y As Double Dim e As Double, tol As Double If a > 0 Then tol = 0.00001 x = a / 2 Do y = (x + a / x) / 2 e = Abs((y - x) / y) x = y If e < tol Then Exit Do Loop SquareRoot = x Else SquareRoot = 0 End If End Function </pre>	<pre> function s = SquareRoot(a) if a > 0 tol = 0.00001; x = a / 2; while(1) y = (x + a / x) / 2; e = abs((y - x) / y); x = y; if e < tol, break, end end s = x; else s = 0; end </pre>

2.8 A MATLAB M-file can be written to solve this problem as

```

function futureworth(P, i, n)
nn = 0:n;
F = P*(1+i).^nn;
y = [nn;F];
fprintf('\n year   future worth\n');
fprintf('%5d %14.2f\n',y);

```

This function can be used to evaluate the test case,

```
>> futureworth(100000,0.06,5)
```

```

year   future worth
0      100000.00
1      106000.00
2      112360.00
3      119101.60
4      126247.70
5      133822.56

```

2.9 A MATLAB M-file can be written to solve this problem as

```

function annualpayment(P, i, n)
nn = 1:n;

```

PROPRIETARY MATERIAL. © The McGraw-Hill Companies, Inc. All rights reserved. No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.

```
A = P*i*(1+i).^nn./((1+i).^nn-1);
y = [nn;A];
fprintf('\n year    annual payment\n');
fprintf('%5d %14.2f\n',y);
```

This function can be used to evaluate the test case,

```
>> annualpayment(55000,0.066,5)

year    annual payment
1         58630.00
2         30251.49
3         20804.86
4         16091.17
5         13270.64
```

2.10 Students could implement the function in any number of languages. The following VBA and MATLAB codes are two possible options.

VBA Function Procedure	MATLAB M-File
<pre>Option Explicit Function avgtemp(Tm, Tp, ts, te) Dim pi As Double, w As Double Dim Temp As Double, t As Double Dim sum As Double, i As Integer Dim n As Integer pi = 4 * Atn(1) w = 2 * pi / 365 sum = 0 n = 0 t = ts For i = ts To te Temp = Tm+(Tp-Tm)*Cos(w*(t-205)) sum = sum + Temp n = n + 1 t = t + 1 Next i avgtemp = sum / n End Function</pre>	<pre>function Ta = avgtemp(Tm,Tp,ts,te) w = 2*pi/365; t = ts:te; T = Tm + (Tp-Tm)*cos(w*(t-205)); Ta = mean(T);</pre>

The function can be used to evaluate the test cases. The following show the results for MATLAB,

```
>> avgtemp(22.1,28.3,0,59)

ans =
    16.2148

>> avgtemp(10.7,22.9,180,242)

ans =
    22.2491
```

2.11 The programs are student specific and will be similar to the codes developed for VBA and MATLAB as outlined in sections 2.4 and 2.5. The numerical results for the different time steps are tabulated below along with an estimate of the absolute value of the true relative error at $t = 12$ s:

Step	$v(12)$	$ e_t $ (%)
2	49.96	5.2
1	48.70	2.6

PROPRIETARY MATERIAL. © The McGraw-Hill Companies, Inc. All rights reserved. No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.

0.5 48.09 1.3

The general conclusion is that the error is halved when the step size is halved.

2.12 Students could implement the subprogram in any number of languages. The following VBA/Excel and MATLAB programs are two examples based on the algorithm outlined in Fig. P2.15.

VBA/Excel	MATLAB
<pre>Option Explicit Sub Bubble(n, b) Dim m As Integer, i As Integer Dim switch As Boolean, dum As Double m = n - 1 Do switch = False For i = 1 To m If b(i) > b(i + 1) Then dum = b(i) b(i) = b(i + 1) b(i + 1) = dum switch = True End If Next i If switch = False Then Exit Do m = m - 1 Loop End Sub</pre>	<pre>function y = Bubble(x) n = length(x); m = n - 1; b = x; while(1) s = 0; for i = 1:m if b(i) > b(i + 1) dum = b(i); b(i) = b(i + 1); b(i + 1) = dum; s = 1; end end if s == 0, break, end m = m - 1; end y = b;</pre>

Notice how the MATLAB length function allows us to omit the length of the vector in the function argument. Here is an example MATLAB session that invokes the function to sort a vector:

```
>> a=[3 4 2 8 5 7];
>> Bubble(a)

ans =
     2     3     4     5     7     8
```

2.13 Students could implement the function in any number of languages. The following VBA and MATLAB codes are two possible options.

VBA Function Procedure	MATLAB M-File
<pre>Option Explicit Function Vol(R, d) Dim V1 As Double, V2 As Double Dim pi As Double pi = 4 * Atn(1) If d < R Then Vol = pi * d ^ 3 / 3 ElseIf d <= 3 * R Then V1 = pi * R ^ 3 / 3 V2 = pi * R ^ 2 * (d - R) Vol = V1 + V2 Else Vol = "overtop" End If End Function</pre>	<pre>function Vol = tankvolume(R, d) if d < R Vol = pi * d ^ 3 / 3; elseif d <= 3 * R V1 = pi * R ^ 3 / 3; V2 = pi * R ^ 2 * (d - R); Vol = V1 + V2; else Vol = 'overtop'; end</pre>

The results are:

R	d	Volume
1	0.5	0.1309
1	1.2	1.675516
1	3	7.330383
1	3.1	overtop

2.14 Here is a flowchart for the algorithm:

Students could implement the function in any number of languages. The following MATLAB M-file is one option. Versions in other languages such as Fortran 90, Visual Basic, or C would have a similar structure.

```

function polar(x, y)
r = sqrt(x.^2 + y.^2);
n = length(x);
for i = 1:n
    if x(i) > 0
        th(i) = atan(y(i) / x(i));
    elseif x(i) < 0
        if y(i) > 0
            th(i) = atan(y(i) / x(i)) + pi;
        elseif y(i) < 0
            th(i) = atan(y(i) / x(i)) - pi;
        else
            th(i) = pi;
        end
    else
        if y(i) > 0

```

```

        th(i) = pi / 2;
    elseif y(i) < 0
        th(i) = -pi / 2;
    else
        th(i) = 0;
    end
end
end
th(i) = th(i) * 180 / pi;
end
ou=[x;y;r;th];
fprintf('\n      x          y          radius      angle\n');
fprintf('%8.2f %8.2f %10.4f %10.4f\n',ou);

```

This function can be used to evaluate the test cases.

```

>> x=[1 1 1 -1 -1 -1 0 0 0];
>> y=[1 -1 0 1 -1 0 1 -1 0];
>> polar(x,y)

      x          y          radius      angle
    1.00      1.00      1.4142      45.0000
    1.00     -1.00      1.4142     -45.0000
    1.00      0.00      1.0000      0.0000
   -1.00      1.00      1.4142     135.0000
   -1.00     -1.00      1.4142    -135.0000
   -1.00      0.00      1.0000     180.0000
    0.00      1.00      1.0000      90.0000
    0.00     -1.00      1.0000     -90.0000
    0.00      0.00      0.0000      0.0000

```

2.15 Students could implement the function in any number of languages. The following VBA and MATLAB codes are two possible options.

VBA Function Procedure	MATLAB M-File
<pre> Function grade(s) If s >= 90 Then grade = "A" ElseIf s >= 80 Then grade = "B" ElseIf s >= 70 Then grade = "C" ElseIf s >= 60 Then grade = "D" Else grade = "F" End If End Function </pre>	<pre> function grade = lettergrade(score) if score >= 90 grade = 'A'; elseif score >= 80 grade = 'B'; elseif score >= 70 grade = 'C'; elseif score >= 60 grade = 'D'; else grade = 'F'; end </pre>

2.16 Students could implement the functions in any number of languages. The following VBA and MATLAB codes are two possible options.

VBA Function Procedure	MATLAB M-File
<pre> (a) Factorial Function factor(n) Dim x As Long, i As Integer x = 1 For i = 1 To n x = x * i Next i factor = x </pre>	<pre> function fout = factor(n) x = 1; for i = 1:n x = x * i; end fout = x; </pre>

PROPRIETARY MATERIAL. © The McGraw-Hill Companies, Inc. All rights reserved. No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.

<pre>End Function (b) Minimum Function min(x, n) Dim i As Integer min = x(1) For i = 2 To n If x(i) < min Then min = x(i) Next i End Function (c) Average Function mean(x, n) Dim sum As Double Dim i As Integer sum = x(1) For i = 2 To n sum = sum + x(i) Next i mean = sum / n End Function</pre>	<pre>function xm = xmin(x) n = length(x); xm = x(1); for i = 2:n if x(i) < xm, xm = x(i); end end function xm = xmean(x) n = length(x); s = x(1); for i = 2:n s = s + x(i); end xm = s / n;</pre>
---	---

2.17 Students could implement the functions in any number of languages. The following VBA and MATLAB codes are two possible options.

VBA Function Procedure	MATLAB M-File
<pre>(a) Square root sum of squares Function SSS(x, n, m) Dim i As Integer, j As Integer SSS = 0 For i = 1 To n For j = 1 To m SSS = SSS + x(i, j) ^ 2 Next j Next i SSS = Sqr(SSS) End Function (b) Normalization Sub normal(x, n, m, y) Dim i As Integer, j As Integer Dim max As Double For i = 1 To n max = Abs(x(i, 1)) For j = 2 To m If Abs(x(i, j)) > max Then max = x(i, j) End If Next j For j = 1 To m y(i, j) = x(i, j) / max Next j Next i End Sub</pre>	<pre>function s = SSS(x) [n,m] = size(x); s = 0; for i = 1:n for j = 1:m s = s + x(i, j) ^ 2; end end s = sqrt(s); function y = normal(x) [n,m] = size(x); for i = 1:n mx = abs(x(i, 1)); for j = 2:m if abs(x(i, j)) > mx mx = x(i, j); end end for j = 1:m y(i, j) = x(i, j) / mx; end end Alternate version: function y = normal(x) n = size(x); for i = 1:n y(i,:) = x(i,:)/max(x(i,:)); end</pre>

2.18 The following MATLAB function implements the piecewise function:

```
function v = vpiece(t)
if t<0
    v = 0;
elseif t<10
    v = 11*t^2 - 5*t;
elseif t<20
    v = 1100 - 5*t;
elseif t<30
    v = 50*t + 2*(t - 20)^2;
else
    v = 1520*exp(-0.2*(t-30));
end
```

Here is a script that uses `vpiece` to generate the plot

```
k=0;
for i = -5:.5:50
    k=k+1;
    t(k)=i;
    v(k)=vpiece(t(k));
end
plot(t,v)
```

2.19 The following MATLAB function implements the algorithm:

```
function nd = days(mo, da, leap)
nd = 0;
for m=1:mo-1
    switch m
        case {1, 3, 5, 7, 8, 10, 12}
            nday = 31;
        case {4, 6, 9, 11}
            nday = 30;
        case 2
            nday = 28+leap;
    end
    nd=nd+nday;
end
nd = nd + da;
```

```

>> days(1,1,0)
ans =
    1
>> days(2,29,1)
ans =
    60
>> days(3,1,0)
ans =
    60
>> days(6,21,0)
ans =
   172
>> days(12,31,1)
ans =
   366

```

2.20 The following MATLAB function implements the algorithm:

```

function nd = days(mo, da, year)
leap = 0;
if year / 4 - fix(year / 4) == 0, leap = 1; end
nd = 0;
for m=1:mo-1
    switch m
        case {1, 3, 5, 7, 8, 10, 12}
            nday = 31;
        case {4, 6, 9, 11}
            nday = 30;
        case 2
            nday = 28+leap;
        end
    nd=nd+nday;
end

```

2.21 A MATLAB M-file can be written as

```

function Manning(A)
A(:,5)=sqrt(A(:,2))./A(:,1).*(A(:,3).*A(:,4))./(A(:,3)+2*A(:,4))).^(2/3);
fprintf('\n      n          S          B          H          U\n');
fprintf('%8.3f %8.4f %10.2f %10.2f %10.4f\n',A');

```

This function can be run to create the table,

```
>> A=[.035 .0001 10 2
      .020 .0002 8 1
      .015 .001 20 1.5
      .03 .0007 24 3
      .022 .0003 15 2.5];
>> Manning(A)
```

n	S	B	H	U
0.035	0.0001	10.00	2.00	0.3624
0.020	0.0002	8.00	1.00	0.6094
0.015	0.0010	20.00	1.50	2.5167
0.030	0.0007	24.00	3.00	1.5809
0.022	0.0003	15.00	2.50	1.1971

2.22 A MATLAB M-file can be written as

```
function beam(x)
xx = linspace(0,x);
n=length(xx);
for i=1:n
    uy(i) = -5/6.*(sing(xx(i),0,4)-sing(xx(i),5,4));
    uy(i) = uy(i) + 15/6.*sing(xx(i),8,3) + 75*sing(xx(i),7,2);
    uy(i) = uy(i) + 57/6.*xx(i)^3 - 238.25.*xx(i);
end
plot(xx,uy)

function s = sing(xxx,a,n)
if xxx > a
    s = (xxx - a).^n;
else
    s=0;
end
```

This function can be run to create the plot,

```
>> beam(10)
```

2.23 A MATLAB M-file can be written as

```
function cylinder(r, L)
```

If you are a student using this Manual, you are using it without permission.

```
h = linspace(0,2*r);
V = (r^2*acos((r-h)./r)-(r-h).*sqrt(2*r*h-h.^2))*L;
plot(h, V)
```

This function can be run to create the plot,

```
>> cylinder(2,5)
```

2.24 Before the chute opens ($t < 10$), Euler's method can be implemented as

$$v(t + \Delta t) = v(t) + \left[9.8 - \frac{10}{80} v(t) \right] \Delta t$$

After the chute opens ($t \geq 10$), the drag coefficient is changed and the implementation becomes

$$v(t + \Delta t) = v(t) + \left[9.8 - \frac{50}{80} v(t) \right] \Delta t$$

You can implement the subprogram in any number of languages. The following MATLAB M-file is one example. Notice that the results are inaccurate because the stepsize is too big. A smaller stepsize should be used to attain adequate accuracy.

```
function parachute
g = 9.81;
m = 80; c = 10;
ti = 0; tf = 20; dt = 2;
vi = -20;
tc = 10; cc = 50;
np = (tf - ti) / dt;
t = ti; v = vi;
tout(1) = t; vout(1) = v;
for i = 1:np
    if t < tc
        dvdt = g - c / m * v;
    else
        dvdt = g - cc / m * v;
    end
    v = v + dvdt * dt;
    t = t + dt;
```

```

    tout(i+1) = t; vout(i+1) = v;
end
plot(tout,vout)
z=[tout;vout]
fprintf('    t          v\n');
fprintf('%5d %10.3f\n',z);

```

```

    t          v
    0        -20.000
    2         4.620
    4        23.085
    6        36.934
    8        47.320
   10        55.110
   12         5.842
   14        18.159
   16        15.080
   18        15.850
   20        15.658

```

2.25 Students could implement the function in any number of languages. The following VBA and MATLAB codes are two possible options.

VBA/Excel	MATLAB
<pre> Option Explicit Function fac(n) Dim x As Long, i As Integer If n >= 0 Then x = 1 For i = 1 To n x = x * i Next i fac = x Else MsgBox "value must be positive" End End If End Function </pre>	<pre> function f = fac(n) if n >= 0 x = 1; for i = 1: n x = x * i; end f = x; else error 'value must be positive' end </pre>
