70) From a molecular orbital perspective, why is there relatively free rotation about the carbon-carbon bond of ethane ( $\text{CH}_3\text{CH}_3$ )?

Answer: This carbon-carbon  $\sigma$  bond is formed by the cylindrically symmetric overlap of two  $sp^3$  hybrid orbitals. Rotation about this bond does not disrupt the orbital overlap.

MCAT LO: MCAT2.9

71) From a molecular orbital perspective why isn't there relatively free rotation about the carbon-carbon double bond in ethene ( $\text{CH}_2=\text{CH}_2$ )?

Answer: Two carbon p atomic orbitals overlap side-to-side and in phase to form the  $\pi$  bond that is present. Rotation about the carbon-carbon bond axis requires quite a bit of energy because the  $\pi$  bond is broken as the overlap between the two p orbitals is disrupted.

72) Explain why the free rotation about the carbon-carbon bond in  $\text{CH}_3\text{CH}_3$  is not present in  $\text{CH}_2\text{CH}_2$ .

Answer: The single carbon-carbon sigma bond present in  $\text{CH}_3\text{CH}_3$  is formed by the overlap of two C  $sp^3$  hybrid atomic orbitals. The overlap of these orbitals is not disrupted by rotation about the carbon-carbon bond axis. In the case of  $\text{CH}_2\text{CH}_2$ , the carbon-carbon bond is a double bond with both a sigma and pi bond present. Rotation about the carbon-carbon bond axis disrupts the overlap of the two carbon p orbitals forming the pi bond.

Answer:  $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$  has the higher boiling point. As the degree of branching increases, the surface area of the molecule decreases and the potential for intermolecular attraction via London forces decreases. Greater surface area leads to a more intermolecular attraction which in results in a higher boiling point.

Answer: One would not expect NaCl to be highly soluble in hexane. NaCl is an ionic solid (i.e., a very polar material) while hexane is nonpolar. Nonpolar solvent molecules do not solvate ions well. The attractions of oppositely charged ions to each other are vastly greater than the weak attractions of the ions for the solvent.
