

## Chapter 2: RESEARCH METHODS

### Critical Thinking Questions

- 1) Describe how the use of research designs protects us from heuristics and cognitive biases.

Answer: Answers will vary but should contain the following information for full credit.

--Student should mention that research requires that we make our predictions beforehand so that the hindsight bias does not lead us to exaggerate our abilities to correctly understand a complex world.

--The research studies use techniques that focus on recording or gathering information so that our intuitions are not allowed to bias the results (such as avoiding availability and representativeness heuristics).

--Designs themselves have limitations so that further research is needed to establish the reliability and validity of our findings.

*Question ID: Lil 3ce 2.5-1*

*Diff: 2*

*Type: ES*

*Page Ref: 45–46*

*Topic: How We Can Be Fooled: Two Modes of Thinking*

*Skill: Applied/Conceptual*

- 2) Use your knowledge of the case study and naturalistic observation to show why they are better devices for identifying important topics for further study rather than being designs that allow for theory building and testing.

Answer: Answers will vary but should contain the following for full credit.

--Both are examples of descriptive research designs (identifying and organizing information about general patterns of behaviours) rather than examples of either predictive (i.e., correlational) or causal (i.e., experimental) designs.

--Both lack important elements of more complex designs that allow theory testing (lack of controls, inability in most cases to separate elements to allow greater understanding of what is necessary and what is not for a behaviour to occur, studying a few people that may not be representative of larger population).

--Direct interaction by researcher with people may strongly influence the data they provide to us (which is often minimized by other methods).

*Diff: 3*

*Type: ES*

*Page Ref: 47–49*

*Topic: Naturalistic Observation: Studying Humans “In the Wild” & Case Study*

*Designs: Getting to Know You*

*Skill: Applied/Conceptual*

- 3) Discuss why researchers need to be familiar with both descriptive and inferential statistics.

Answer: Answers will vary but should contain the following ideas for full credit.

--Student needs to mention that each gives a different kind of information because each has differing goals (organization and summarization for descriptive and generalization for inferential).

--Techniques in each can be misused in different ways to make effects appear that really are not accurate or appropriate.

--Often both are used in conjunction by the researcher rather than being two types that are chosen between (e.g., using the means of the groups to help see the statistically significant group differences).

## Chapter 2: RESEARCH METHODS

### Essay Questions

- 1) Why is it necessary for psychologists to have so many different research designs to study human behaviour?

Answer: Answers will vary but should contain the following points for full credit.

--Each research design has its own important limitations. Student should identify at least two examples from two different designs to earn full credit.

--The goals of research differ (some focus on description, others on predictions, and others on establishing causation).

--If different methods produce similar results, this increases our confidence in our understanding of a particular phenomenon (idea of convergence).

*Question ID: Lil 3ce 2.4-1*

*Diff: 3*

*Type: ES*

*Page Ref: 47–66*

*Topic: The Scientific Method: Toolbox of Skills*

*Skill: Applied/Conceptual*

- 2) Distinguish between the different types of reliability and validity, and what are the main differences between them.

Answer: Answers will vary but should contain the following points for full credit.

--Reliability: consistency of measurement (subtypes test–retest reliability: scores over a period of time; interrater: scores/coding done by raters on the same data)

--Validity: measuring what you are claiming to measure (related to internal and external validity)

*Question ID: Lil 3ce 2.4-8*

*Diff: 2*

*Type: ES*

*Page Ref: 51–52*

*Topic: Self-Report Measures and Surveys: Asking People about Themselves and Others*

*Skill: Factual*

- 3) Compare and contrast the differences between a correlational and experimental design.

Answer: Answers will vary but should contain the following points for full credit.

--Correlation: measures two variables that often can't be manipulated; examines relationships (positive or negative) between variables and the strength of those associations; cannot make causal conclusions but can test preliminary ideas

--Experiment: uses dependent (measured) and independent (manipulated) variables; examines cause-and-effect relationships; permits causal conclusions; requires random assignment and manipulation of IV

*Question ID: Lil 3ce 2.4-7*

*Diff: 2*

*Type: ES*

*Page Ref: 53–60*

*Topic: Correlational Designs & Experimental Designs*

*Skill: Applied/Conceptual*

- 4) Illustrate why being an informed consumer about research, research designs, and statistics will be helpful in identifying incorrect statements about research in the media and on the Internet.

Answer: Answers will vary but should contain *at least four* of the following, including the first idea, for full credit.

--Student should mention that understanding research designs will aid in identifying when statements of cause and effect are appropriate and when they are not. (Need to give supportive evidence for this and all statements to see that they truly demonstrate an understanding of each idea.)

--One will recognize misleading or inaccurate statistical statements.

--One will recognize when headlines are inaccurate summaries of the research results.

--One will recognize when reporters or writers have used sharpening or leveling.

--One will consider the source and whether the story coverage is balanced or whether it muddies the discussion.

*Question ID: Lil 3ce 2.4-3*

*Diff: 3*

*Type: ES*

*Page Ref: 53–58, 75*

*Topic: Correlational Designs & Most Reporters Aren't Scientists: Evaluating Psychology in the Media*

*Skill: Applied/Conceptual*

- 5) Discuss how the concept of the illusory correlation would explain a friend's complaint that his fraternity/her sorority (or other student group) is always being displayed in a negative light by the campus newspaper while other groups are not treated the same.  
Answer: Answers will vary but should include the following to earn full credit.

--Student should define or describe what the illusory correlation is in his or her answer (either directly or demonstrate an understanding indirectly).

--Student should discuss the general ideas associated with the Great Fourfold Table of Life from page 56. More specifically, he or she should focus on the fact that the student—in the question—is focusing on instances where negative portrayal of the fraternity/sorority are occurring but is neglecting stories about the fraternity/sorority that are positive or have no evaluative component. Likewise, the student—in the question—is also ignoring when other groups are discussed negatively or other negative stories that are irrelevant to friend's group are published.

*Question ID: Lil 3ce 2.4-2*

*Diff: 2*

*Type: ES*

*Page Ref: 56–57*

*Topic: Correlational Designs*

*Skill: Applied/Conceptual*

- 6) Identify and describe two pitfalls in experimental design, what the implications are for interpreting the results of a study with these pitfalls, and how these pitfalls can be avoided.

Answer: Answers will vary but should contain the any of the two following points for full credit.

--Placebo effect: improvement resulting from expectations, implications are that improvements may not be stemming from the “treatment” per se, can overcome this by using single-blind procedures

--Nocebo effect: harm resulting from the mere expectation of harm, people can subjectively experience pain if they believe they may be hurt, can overcome using single-blind procedures

--Experimenter expectancy effect: researcher's predictions unintentionally bias the outcome of a study, implications are that the experimenter can sometimes give away cues without knowing it that influence the participants' behaviours, can overcome by double-blind procedures

--Demand characteristics: cues that participants pick up from an experiment that allow them to guess what the hypothesis of a study does, implications are that the participants can alter their behaviour based on their knowledge of the study, can overcome by double-blind procedures

*Question ID: Lil 3ce 2.4-4*

*Diff: 2*

*Type: ES*

*Page Ref: 61–65*

*Topic: Experimental Designs*

*Skill: Factual*

- 7) Describe the roles of research ethics boards and statements of informed consent within the human research process.

Answer: Answers will vary but should contain the following for full credit.

--Research ethics boards (REBs) review all research carefully with an eye toward protecting participants against abuses. REBs consist of faculty members with expertise in research and ethics, as well as community members who are not involved in research or with the institution, performing and reviewing the research.

--The informed consent ensures that participants understand what is being asked of them and what will be involved in their experience. Participants must be given enough information to make a decision to voluntarily participate in the research. If they are misled during the research, the missing information must be explained during a debriefing.

*Question ID: Lil 3ce 2.4-5*

*Diff: 2*

*Type: ES*

*Page Ref: 67–68*

*Topic: Ethical Guidelines for Human Research*

*Skill: Factual*

- 8) Explain why no single measure of central tendency and measure of dispersion exists that a researcher can use every single time.

Answer: Answers will vary but should contain the following information for full credit.

--Sometimes one measure is more appropriate than another. For example, the mean is distorted by the presence of outliers in a skewed distribution, so a researcher would be advised to report the median instead.

--It depends what information a researcher wants to highlight. For example, if a researcher wants to identify what was the most frequently endorsed option for a question, he or she would choose the mode. If he or she wants to report about how the scores were represented over all the possible answers, he or she would report the mean.

--Some people may wish to know the typical difference between scores and thus choose standard deviation while others would look at the amount of difference from the most extreme scores and choose the range.

--A researcher cannot just report central tendency or just dispersion because it tells only part of the whole, either where scores are located (central tendency) or how much difference between scores is present (dispersion).

*Diff: 3*

*Type: ES*

*Page Ref: 70*

*Topic: Descriptive Statistics: What's What?*

*Skill: Applied/Conceptual*

- 9) Your friend Sasha has approached you because she just read an article in the *Paranormal Enquirer* magazine that described a research finding that introverts are more likely to have extrasensory perception (ESP). What tips would you recommend to your friend in evaluating the legitimacy of this claim?

Answer: Answers will vary but should contain the following points for full credit.

--Consider the source of the claim (and explain).

--Be aware of excessive sharpening (exaggeration of gist/central message) or leveling (minimize less central details of a study).

--Don't be misled by seemingly balanced coverage of a story.

## Chapter 2: RESEARCH METHODS

### Fill in the Blank Questions

- 1) If a researcher investigated the topic of aggression by simply recording instances of aggression on a school playground, in a place of business, in a nightclub, and in many other everyday settings, he or she would be using the research design of naturalistic observation.

*Question ID: Lil 3ce 2.3-1*

*Diff: 1*

*Page Ref: 47*

*Topic: Naturalistic Observation: Studying Humans “In the Wild”*

*Skill: Applied/Conceptual*

- 2) Random selection (or random sampling) is the most important part of ensuring the generalizability of one’s results to the general population.

*Question ID: Lil 3ce 2.3-2*

*Diff: 2*

*Page Ref: 49–50*

*Topic: Self-Report Measures and Surveys: Asking People about Themselves and Others*

*Skill: Factual*

- 3) Dr. Barrios is examining the relationship between student scores on a practice test in his senior-level class with their actual performance, with different questions, on his first exam. If there is consistency or stability in these scores, Dr. Barrios would be able to say that reliability exists.

*Question ID: Lil 3ce 2.3-3*

*Diff: 2*

*Page Ref: 51*

*Topic: Self-Report Measures and Surveys: Asking People about Themselves and Others*

*Skill: Factual*

- 4) An important concern in research is that people will respond in a manner that conveys a specific impression rather than in a way that reflects his or her true behaviour. When people do this to make themselves appear more skilled than they really are, they are engaging in the response set of positive impression management.

*Question ID: Lil 3ce 2.3-4*

*Diff: 2*

*Page Ref: 52*

*Topic: Self-Report Measures and Surveys: Asking People about Themselves and Others*

*Skill: Applied/Conceptual*

- 5) The degree of statistical association between two variables is the focus of correlational designs.

*Question ID: Lil 3ce 2.3-5*

*Diff: 1*

*Page Ref: 53*

*Topic: Correlational Designs*

*Skill: Factual*

- 6) The major advantage of a correlational design over a naturalistic observation or a case study design is that a correlational design allows us to make predictions (or make predictions about future events or describe and make predictions about behaviour).

*Question ID: Lil 3ce 2.3-7*

*Diff: 2*

*Page Ref: 54*

*Topic: Correlational Designs*

*Skill: Applied/Conceptual*

- 7) According to the authors, many examples of superstitious behaviour are the result of illusory correlation.

*Question ID: Lil 3ce 2.3-6*

*Diff: 3*

*Page Ref: 56*

*Topic: Correlational Designs*

## Chapter 2: RESEARCH METHODS

### Multiple Choice Questions

- 1) What is one take-home message from the discussion of autism and facilitated communication?
- The scientific method is not an effective means for finding solutions for persons who live with autism and other psychological disorders.
  - Even in the face of overwhelming evidence, some people won't abandon their erroneous beliefs.
  - Autistic children want to communicate with their parents but need someone to facilitate the process.
  - Psychological research is dangerous because it allows anyone to find support for any idea or opinion.

Answer: b

*Question ID: Lil 3ce 2.1-1*

*Diff: 2*

*Type: MC*

*Page Ref: 43–44*

*Topic: Research Methods: Safeguards Against Error (Introduction)*

*Skill: Applied/Conceptual*

- 2) The discussion on the topic of facilitated communication demonstrated the importance of
- parsimonious theories.
  - developing falsifiable hypotheses.
  - replication of earlier research findings.
  - ruling out rival hypotheses.

Answer: d

- 3) Sahar attended a workshop on how crystals have healing power, can eliminate “blood sludge,” and cure mental illness. The workshop facilitator presented clinical observations of several patients to demonstrate the effectiveness of crystals. What should Sahar keep in mind as she evaluates the information she learned in this workshop?
- In the absence of systematic research, clinical observations are not sufficient evidence for their effectiveness.
  - Clinical observations are a powerful source of evidence and demonstrate treatment effectiveness.

- c. Patients' own reports that crystals cured their cancer or depression provide empirical evidence of their effectiveness.
- d. The workshop facilitator appears to be a credible source so his claims must be true.

Answer: a

- 31) Dr. Didus has diagnosed a patient with dissociative identity disorder (DID), a very rare type of dissociative disorder. He observes the behaviour of his patient and her alter personalities and discovers that every time he asks her about sexual experiences, an alter that is a male takes over as the dominant personality. Based on his case study, what can Dr. Didus conclude about DID in general?
- a. Patients with DID cannot cope with discussing uncomfortable experiences.
  - b. Sexual experiences are linked with the presence of alter experiences.
  - c. Opposite gender personalities take over to protect the host personality when talking about sex.
  - d. No conclusions can be drawn about DID without systematic research on this population.

- 93) Pretend that you are a peer reviewer for a study on exposure therapy and arachnophobia (fear of spiders). The researcher chooses a group of patients who he thinks can handle the treatment (administered by a colleague) and has another group of patients as a control that he talks to about their fears weekly. He reports that, following exposure therapy, those in the experimental group showed less fear of spiders than those in the control group. As a reviewer, what is the hidden flaw with this study that limits its claims?
- The researcher has not controlled for the placebo effect.
  - There is no random assignment so it is not an experiment.
  - The study has no dependent variable.
  - The researcher has not controlled for the experimenter expectancy effect.

*Answer: b*

*Skill: Applied/Conceptual*

- 129) Suppose a researcher invites an individual participant to a sleep laboratory, but he refuses to fall asleep. Hours go by and the researcher cannot understand why the participant won't sleep. In the morning, a very tired participant asks if the real purpose of the study was to observe his reaction to having a rat in the bed with him. That the participant purposefully stayed awake thinking this was the nature of the study demonstrates
- demand characteristics.
  - participant observation.
  - overt observation.
  - covert observation.

Answer: a

- 184) The results from J.B. Rhine's studies using Zener cards at Duke University in the 1930s were challenged because subjects could
- guess the card based on the behaviour of the card reader.
  - guess the order of the cards over time.
  - see the card in a reflection off Rhine's spectacles.
  - see through the cards since they were so worn down.

*Answer: d*
