

## Chapter 2 Psychology's Scientific Method

1. The first step of the scientific method in psychology involves
- A. observing some phenomenon in the world.
  - B. formulating hypotheses and predictions.
  - C. testing through empirical research.
  - D. evaluating the theory based on the conclusions drawn.

Page: 26

APA Outcome: 2.2 Demonstrate psychology information literacy

Bloom's: Remember

Difficulty: Low

Learning Objective: Outline the steps of the scientific method.

Topic: Scientific Method

Feedback: Psychology's Scientific Method

2. In the context of psychology's scientific method, a variable is anything that
- A. can change.
  - B. increases experimenter bias.
  - C. decreases research participant bias.
  - D. remains constant.

Bloom's: Remember

Difficulty: Low

Learning Objective: Outline the steps of the scientific method.

Topic: Variables

Feedback: Step 3. Testing Through Empirical Research

3. For a research project, Joaquin observes student behavior during a learning task and attempts to form a \_\_\_\_\_, which is a broad idea or set of closely related ideas that attempts to explain observations and to make predictions about future observations.
- A. Theory
  - B. Variable
  - C. Statistic
  - D. Bias

Page: 26

APA Outcome: 1.1 Describe key concepts, principles, and overarching themes in psychology

Accessibility: Keyboard Navigation

Bloom's: Apply

Difficulty: Medium

Learning Objective: Outline the steps of the scientific method.

Topic: Theories

Feedback: Step 1. Observing Some Phenomenon

4. In the context of psychology's scientific method, theory is defined as
- A. anything that can change.
  - B. the specific expectation for the outcome of a study.
  - C. a set of closely related ideas that attempts to explain observations.
  - D. the mathematical procedure used to interpret data.

Page: 26

APA Outcome: 1.1 Describe key concepts, principles, and overarching themes in psychology

Accessibility: Keyboard Navigation

Bloom's: Remember

Difficulty: Low

Learning Objective: Outline the steps of the scientific method.

Topic: Theories

Feedback: Step 1. Observing Some Phenomenon

5. In the context of psychology's scientific method, which of the following is true of theories?
- A. Theories explain relations between variables on a conceptual level.
  - B. Theories are educated guesses that derive logically from a hypothesis.

- C. Theories cannot explain the occurrences of phenomena.
- D. Theories cannot be used to make predictions about future observations.

Page: 26

APA Outcome: 1.1 Describe key concepts, principles, and overarching themes in psychology

Accessibility: Keyboard Navigation

Bloom's: Understand

Difficulty: Medium

Learning Objective: Outline the steps of the scientific method.

Topic: Theories

Feedback: Step 1. Observing Some Phenomenon

6. Dr. Kate proposes that students find it difficult to return to their academic schedules after spring break. Specifically, she predicts that every year there will be more student absences on the Monday following spring break than on the Friday before spring break. The first statement describes the \_\_\_\_\_, while the second is the \_\_\_\_\_.

A. design of the study; research method

**B.** theory; hypothesis

C. hypothesis; operational definition

D. prediction; procedure

Page: 26,28

APA Outcome: 2.2 Demonstrate psychology information literacy

Accessibility: Keyboard Navigation

Bloom's: Apply

Difficulty: High

Learning Objective: Distinguish between theory and hypothesis.

Topic: Scientific Method

Feedback: Step 1. Observing Some Phenomenon

Feedback: Step 2. Formulating Hypotheses and Predictions

7. In the context of psychology's scientific method, a(n) \_\_\_\_\_ is an educated guess that derives logically from a theory.

A. operational definition

B. fact

**C.** hypothesis

D. variable

Page: 27

APA Outcome: 2.2 Demonstrate psychology information literacy

Accessibility: Keyboard Navigation

Bloom's: Remember

Difficulty: Low

Learning Objective: Distinguish between theory and hypothesis.

Topic: Hypotheses

Feedback: Step 2. Formulating Hypotheses and Predictions

8. Allie has developed a theory concerning test grades of high school students. She believes that there is a strong causal relationship between students' levels of happiness and their grades in school. In this scenario, her expectation that happier students get better grades is a \_\_\_\_\_ derived from her theory.

A. variable

B. bias

C. fact

**D.** hypothesis

Page: 27

APA Outcome: 1.3 Describe applications of psychology

Accessibility: Keyboard Navigation

Bloom's: Apply

Difficulty: High

Learning Objective: Distinguish between theory and hypothesis.

Topic: Hypotheses

Feedback: Step 2. Formulating Hypotheses and Predictions

9. Ciara believes that working women are happier than women who do not work. She predicts that women who work for at least 10 years are more likely to have good mental health after the age of 50 years than women who do not. She decides to test this prediction. In the context of psychology's scientific method, Ciara's prediction is the \_\_\_\_\_ for the study she is going to conduct.

A. variable

B. confound

C. placebo

## **D.** hypothesis

Page: 27

APA Outcome: 2.4 Interpret, design, and conduct basic psychological research

Accessibility: Keyboard Navigation

Bloom's: Apply

Difficulty: High

Learning Objective: Outline the steps of the scientific method.

Topic: Hypotheses

### Feedback: Step 2. Formulating Hypotheses and Predictions

10. In surveys conducted by Gerald, many adolescents report that they started smoking cigarettes because of peer pressure. While observing adolescent groups, however, Gerald rarely sees adolescents offering each other cigarettes or putting pressure on others to smoke. Gerald predicts that if he conducts further studies on this topic, he will be able to prove that peer pressure is not the primary reason that adolescents start smoking cigarettes. In the context of psychology's scientific method, Gerald is basing his further studies on

A. a demand characteristic.

**B.** a hypothesis.

C. confounds.

D. third variable problems.

Page: 27

APA Outcome: 2.4 Interpret, design, and conduct basic psychological research

Accessibility: Keyboard Navigation

Bloom's: Apply

Difficulty: High

Learning Objective: Outline the steps of the scientific method.

Topic: Hypotheses

### Feedback: Step 2. Formulating Hypotheses and Predictions

11. After careful observation, Dylan states a hypothesis that spending money on other people leads to greater happiness than spending money on oneself. In accordance with the scientific method, which of the following steps is Dylan most likely to take next?

A. He will choose a confederate who will determine the operational definition.

**B.** He will examine the prediction through empirical research.

C. He will use longitudinal design to increase research participant bias.

D. He will conduct a correlational research.

Page: 27

APA Outcome: 1.3 Describe applications of psychology

Accessibility: Keyboard Navigation

Bloom's: Apply

Difficulty: High

Learning Objective: Outline the steps of the scientific method.

Topic: Theories

### Feedback: Step 3. Testing Through Empirical Research

12. Which of the following methods is used to gain knowledge through the observation of events, the collection of data, and logical reasoning?

A. Coincidental method

**B.** Empirical method

C. Hypothetical method

D. Conjured method

Page: 27

APA Outcome: 1.1 Describe key concepts, principles, and overarching themes in psychology

Accessibility: Keyboard Navigation

Bloom's: Remember

Difficulty: Low

Learning Objective: Outline the steps of the scientific method.

Topic: Scientific Method

### Feedback: Step 3. Testing Through Empirical Research

13. In the context of psychology's scientific method, the objective description of how a variable is going to be measured and observed in a particular study is referred to as the

A. hypothesis.

B. theory.

C. logical conclusion.

**D.** operational definition.

Page: 28

Learning Objective: Outline the steps of the scientific method.  
Topic: Scientific Method

Feedback: Step 3. Testing Through Empirical Research

14. Ashton, a biology student, wants to study butterflies using the scientific method. Which of the following scenarios represents a step or steps in the scientific method?

- A. While watching the butterflies, Ashton notices a phenomenon in their feeding behavior.
- B. Ashton makes a logical educated guess to predict the butterflies' future behaviors.
- C. Ashton tests his prediction by recording objective information about the butterflies.
- D.** All of these answers are correct.

Page: 26–28

Accessibility: Keyboard Navigation

Bloom's: Remember

Difficulty: Low

Learning Objective: Outline the steps of the scientific method.

Topic: Hypotheses

Feedback: Step 3. Testing Through Empirical Research

20. In the context of evaluating theories in psychology, \_\_\_\_\_ replication means doing a study precisely as it was conducted in its original form.

- A. theoretical
- B. abstract
- C. conceptual
- D. direct**

Page: 29

APA Outcome: 2.2 Demonstrate psychology information literacy

Accessibility: Keyboard Navigation

Bloom's: Remember

Difficulty: Low

Learning Objective: Outline the steps of the scientific method.

Topic: Theories

Feedback: Step 5. Evaluating the Theory

21. In the context of evaluating theories in psychology, \_\_\_\_\_ replication means doing a study with different methods or different types of samples.

- A. concrete
- B. hypothetical
- C. conceptual**
- D. direct

Page: 29

APA Outcome: 2.2 Demonstrate psychology information literacy

Accessibility: Keyboard Navigation

Bloom's: Remember

Difficulty: Low

Learning Objective: Outline the steps of the scientific method.

Topic: Theories

Feedback: Step 5. Evaluating the Theory

22. \_\_\_\_\_ is a statistical procedure that summarizes a large body of evidence from the research literature on a particular topic, allowing the researcher to assess the strength of the relationship between the variables.

- A. Meta-analysis**
- B. Replication

- C. Substantiation
- D. Verification

Page: 29

APA Outcome: 1.1 Describe key concepts, principles, and overarching themes in psychology

Accessibility: Keyboard Navigation

Bloom's: Remember

Difficulty: Low

Learning Objective: Outline the steps of the scientific method.

Topic: Theories

Feedback: Step 5. Evaluating the Theory

23. Bradley conducts research to validate his hypothesis that increased job satisfaction leads to greater organizational commitment among employees. He collates the existing data from all of the studies that he can locate on the topic. By looking at the data, he establishes that his hypothesis has been consistently proven correct across the studies. In this scenario, the method of study used by Bradley is

- A. direct replication.
- B. correlational research.
- C. meta-analysis.**
- D. experimental design.

Page: 29

APA Outcome: 2.2 Demonstrate psychology information literacy

Accessibility: Keyboard Navigation

Bloom's: Apply

Difficulty: High

Learning Objective: Outline the steps of the scientific method.

Topic: Hypotheses

Feedback: Step 5. Evaluating the Theory

24. Meta-analytic results in psychological research are more powerful than the results of a single study because the meta-analytic results

- A. combine many findings in the literature.**
- B. encourage experimenter bias.
- C. refrain from obtaining informed consent.
- D. use confounders to determine the independent variable.

Page: 29

APA Outcome: 1.2 Develop a working knowledge of psychology's content domains

Accessibility: Keyboard Navigation

Bloom's: Understand

Difficulty: Medium

Learning Objective: Outline the steps of the scientific method.

Topic: Theories

Feedback: Step 5. Evaluating the Theory

25. \_\_\_\_\_ is a type of psychological research that uses surveys, case studies, and interviews to find out the basic dimensions of some variable.

- A. Experimental research
- B. Descriptive research**
- C. Correlational research
- D. Developmental research

Page: 30

Feedback: Avoid Overgeneralizing Based on Little Information

150. Jennifer has had a troubled past and has been emotionally affected by her parents' divorce. Jennifer's therapist suggests that she write a book about her life; he says that this will be therapeutic for Jennifer and might help her get closure on her past. Which of the following guidelines should Jennifer follow while attempting to write this book?
- A. She should explore various topics through her writing.
  - B. She should focus on punctuation, grammar, and spelling while writing.
  - C. She should dedicate herself to a few minutes of writing each day.**
  - D. She should write about her negative thoughts and emotions, even if this makes her uncomfortable.

Feedback: The Scientific Method and Health and Wellness

151. What is an operational definition? Explain its importance in the field of psychology.

An operational definition is an objective description of a variable being measured in a given study. The purpose of an operational definition is to eliminate the fuzziness in defining psychological phenomena and provide a common language to facilitate communication among researchers.

*Learning Objective: Outline the steps of the scientific method.*  
*Topic: Scientific Method*

152. Briefly describe the process of replication in the final step of psychology's scientific method.

Replicating a study means repeating it and getting the same results. Scientific conclusions rely on showing that the results remain the same, regardless of the specific scientist who conducts the study or the specific group of people who were studied. Direct replication means doing the study precisely as it was conducted in its original form. Conceptual replication means doing the study with different methods or different types of samples. For instance, a researcher might want to know if a particular strategy to enhance social skills works not only for college students but for older adults or for individuals with autism. If a research finding is shown again and again—that is, if it is replicated—across different researchers and different specific methods, it is considered reliable. It is a result on which researchers can depend.

153. Discuss two limitations of using surveys in research.

Although surveys can be a straightforward way to measure psychological variables, constructing them requires care. For example, surveys can measure only what people think about themselves. Thus, if researchers are interested in studying a variable that they believe is unconscious, such as a psychodynamic drive, they cannot use a survey. Furthermore, people do not always know the truth about themselves. If a person was answering a survey that asked, "Are you a generous person?" how might the person's answer compare to that of a friend who is asked to make that same rating about the person? One particular problem with surveys and interviews is the tendency of participants to answer questions in a way that will make them look good rather than in a way that communicates what they truly think or feel.

*Learning Objective: Identify and discuss the types of research that are used in psychology.*  
*Topic: Survey Research*

154. Alfred conducted a study on the relationship between playground aggression observed in 5-year-old boys and their time spent playing with toy guns. The data he obtained gave him a correlation coefficient of +0.64. Explain what this coefficient means with reference to a graph, indicate the approximate appearance of the line, and discuss the strength and direction of the relationship.

The correlation coefficient represents a positive correlation between the two variables in the study. Because the correlation coefficient is a positive number, the slope of the line on a graph must move in the positive direction with one variable on each axis. A positive correlation means that as variable A increases, so does variable B.

(Note: The answer should clearly spell out that the correlation observed does not indicate that there is a cause and effect relationship between the variables. An answer that does not address cause and effect at all should not receive full credit.)

*APA Outcome: 2.2 Demonstrate psychology information literacy*  
*Bloom's: Understand*  
*Difficulty: High*  
*Learning Objective: Describe how correlational research determines the relationship between two sets of variables.*  
*Topic: Correlational Research*

155. Explain the third variable problem of correlational research with an example.

Student answers will vary. The circumstance where a variable that has not been measured accounts for the relationship between two other variables is known as the third variable problem.

For example, a researcher measures two variables: the number of ice cream cones sold in a town and the number of violent crimes that occur in that town throughout the year. The researcher finds that ice cream cone sales and violent crimes are positively correlated, to the magnitude of +.50. This

high positive correlation would indicate that as ice cream sales increase, so does violent crime. It would not be reasonable for the local paper to run the headline “Ice Cream Consumption Leads to Violence.” A third variable that can possibly explain this correlation is “heat.” Indeed, when it is hot outside, people are more likely both to purchase ice cream and to act aggressively.

APA Outcome: 2.2 Demonstrate psychology information literacy

Bloom's: Understand

Difficulty: High

Learning Objective: Describe how correlational research determines the relationship between two sets of variables.

Topic: Correlational Research

156. Explain the difference between a dependent variable and an independent variable in experimental research.

An independent variable is the one believed to influence the other variable. The variable hypothesized to be influenced is called the dependent variable. The independent variable is the variable that the experimenter changes to see what its effects are; it is a potential cause.

A dependent variable in an experiment is the variable that may change as a result of manipulations of the independent variable. It represents the outcome (effect) in an experiment. As researchers manipulate the independent variable, they measure the dependent variable to test for any effect of the manipulated variable.

Independent and dependent variables are two of the most important concepts in psychological research.

Despite their similar names, they are very different. Remember that the independent variable is the cause, and the dependent variable is the effect.

The independent variable is the one that is manipulated, and the dependent variable is the outcome.

Topic: Variables

157. Dr. Schwartzmiller believes that herbal medicines significantly reduce the number of depressive symptoms in women. She wants to use experimental methods to test her hypothesis. What components of a well-designed experiment should be included in this study?

To test her hypothesis experimentally, Dr. Schwartzmiller should randomly assign her participants to receive either no medicine (control group) or some amount of the medicine (experimental groups). This means that participants are equally likely to be in either the control or experimental groups, and that all the other ways in which participants differ from each other will be distributed across the groups. Participants in the control group receive no medicine, whereas those in the experimental groups receive some dose of the medicine (e.g., 1 pill, 2 pills, and so on). The importance of having a control group is that Schwartzmiller will be able to say that any changes in the experimental participants' number of symptoms are due to the medicine, and not due to normal fluctuations in depressive symptoms.

Bloom's: Understand

Difficulty: High

Learning Objective: Understand how experimental research can establish cause and effect relationships.

Topic: Experimental Research

158. Explain the concepts of experimental groups and control groups with examples.

Student answers will vary. An experimental group consists of participants in an experiment who receive the drug or other treatment under study—that is, those who are exposed to the change that the independent variable represents. On the other hand, a control group consists of participants in an experiment who are as much like the experimental group as possible and who are treated in every way like the experimental group except for a manipulated factor, the independent variable. For example, a researcher notices that people who listen to classical music seem to be of above average intelligence. He creates two groups: one that listens to classical music and one that does not. To test for differences in intelligence, the researcher then measures intelligence in the two groups. Here, the experimental group is the group that listened to classical music; the no-music group is the control group.

Difficulty: Medium

Learning Objective: Understand how experimental research can establish cause and effect relationships.

Topic: Experimental Research

159. Describe the placebo effect. Provide an example to explain how this effect works.

Student answers will vary. The placebo effect occurs when participants' expectations, rather than the experimental treatment, produce a particular outcome. Participants in a drug study might be assigned to an experimental group that receives a pill containing an actual painkiller or to a control group that receives a placebo pill. A placebo is a harmless substance that has no physiological effect. This placebo is given to participants in a control group so that they are treated identically to the experimental group except for the active agent—in this case, the painkiller. Giving individuals in the control group a placebo pill allows researchers to determine whether changes in the experimental group are due to the active drug agent and not simply to participants' expectations.

Learning Objective: Identify possible sources of experimental bias in research.

Topic: Experimental Research

160. Explain the concepts of random assignment and random sample. State the difference between the two.

Random assignment refers to the assignment of research participants to groups by chance, to reduce the likelihood that an experiment's results will be due to preexisting differences between groups. A random sample refers to a sample that gives every member of the population an equal chance of being selected.

A random sample is not the same thing as random assignment. Random assignment is about making sure experimental and control groups are equivalent, and a random sample is about selecting participants from a population so that the sample is representative of that population.

Topic: Research Samples

161. List four drawbacks of doing research in a laboratory.

Although laboratory research provides a great deal of control, doing research in the laboratory has drawbacks.

First, it is almost impossible to conduct research in a lab without the participants knowing they are being studied. Second, the laboratory setting is not the real world and therefore can cause the participants to behave unnaturally. A third drawback of laboratory research is that individuals who are willing to go to a university laboratory may not be representative of groups from diverse cultural backgrounds. Those who are unfamiliar with university settings and with the idea of "helping science" may be intimidated by the setting. Fourth, some aspects of the mind and behavior are difficult if not impossible to examine in the laboratory.

Learning Objective: Clarify the meaning of statistical significance.

Topic: Measures of Central Tendency

164. Contestants of reality television (TV) shows are often asked to engage in unpleasant behaviors, such as eating bugs or living in isolation for days. While viewers think they are learning about human nature, these experiments are not real psychological studies that employ the scientific method and ethical guidelines as put forth by the American Psychological Association. Describe why these TV shows do not meet the ethical guidelines that psychological research must follow.

These TV shows do not meet the ethical guidelines because the contestants have most often not given their informed consents. Moreover, the TV shows use deception, unreasonable levels of risk, and exorbitant award money as it relates to undue persuasion. There is also a lack of ecological validity. In other words, one cannot really learn much from the contestants of reality TV shows.

165. Briefly describe the research of James Pennebaker with regard to expressive writing and health, and present the guidelines an individual should follow in order to benefit from the healing power of writing.

Pennebaker's research explored the connections between traumatic life events, expressive writing, health, and work performance. He found that writing about traumatic life events had healing effects in that the individuals had improved psychological well-being in comparison to those who experienced similar events but did not write about them. The following guidelines are suggested for those who wish to benefit from the healing power of writing: find a quiet place to write; limit writing to one topic; write for a few minutes each day; do not worry about the conventions of writing; and write about the positives in life.
